

THE BUTTERFLIES OF THE NILGIRI DISTRICT.

BY

J. A. YATES.

In his enumeration of local lists of butterflies, Evans (*Identification of Indian Butterflies*, 2nd edition) mentions Sir George Hampson's list published in the *Journal of the Royal Asiatic Society*, 1888. I venture in the subjoined list to revise his list, both by giving the names as in Evans and by adding butterflies taken subsequently. Brigadier Evans has been good enough to let me see his copy of Hampson's list, with additions made by Stokes Roberts in manuscript. I have also been able to consult Col. Winckworth's list, verified by specimens in his collection. Hampson's excellent description of the area requires no modification. Lastly both Brigadier Evans and Mr. Gabriel of the Entomological Department, British Museum, kindly helped me to verify the fact that certain species have been found in the Nilgiris. These I have specially noted in the following list.

The Nilgiris are popular with collectors, both schoolboy and adult. I thought therefore it might be of service to both classes of collectors to give them a revised list.

I should add that Brigadier Evans thinks that one or two changes will have to be made in nomenclature. He has kindly permitted me to include some of his latest conclusions: notably under *Padraona*, where *Padraona pseudomaesa pseudomaesa* M. replaces *Padraona cato* Evans, and *Padraona pallida pallida* Evans replaces *Padraona pseudomaesa pseudomaesa* M. The *Baoris* group will eventually be split up, I understand; but meanwhile one may note that the form described as *B. mathias* var. *agna* M. (D. S. F.) is now definitely considered as a species.

I have rearranged Hampson's list to make it tally with Evans'. The numbers in brackets are Hampson's original numbers. Where no number occurs the inclusion of a species is due to Stokes Roberts or to Winckworth, or to its being in the British Museum collection.

A. PAPILIONIDAE.

The totals for the Nilgiri District are:—

<i>Papilionidae</i>	18
<i>Pieridae</i>	32
<i>Danaidae</i>	10
<i>Satyridae</i>	25
<i>Amathusiidae</i>	1
<i>Nymphalidae</i>	47
<i>Erycinidae</i>	3
<i>Lycaenidae</i>	80
<i>Hesperiidae</i>	66

—
282
—

I have had the curiosity to compare the lists for the Nilgiri District and Coorg and to tabulate the butterflies found in the one area, but not in the other. They are as follows:—

Nilgiri District.	Coorg.
* <i>Colias hyale nilagiriensis</i> .	<i>Pathysa antiphates naira</i> .
* <i>Pieris canidia canis</i> .	<i>Parantirrhoea marshalli</i> .
<i>Mycalesis visala visala</i> .	<i>Eriboea schreiberi wardi</i> .
<i>Ypthima avanta striata</i> .	<i>Euthalia telchinia</i> .
<i>Ypthima philomela tabella</i> .	<i>Atella alcippe mercea</i> .
* <i>Argynnis hyperbius hybrida</i> .	<i>Gerydus biggsii</i> .
<i>Azanus jesous gamra</i> .	<i>Lycaenesthes emolus emolus</i> .
<i>Lycaenopsis albidisca</i> .	<i>Nacaduba pactolus continen-</i>
<i>Lycaenopsis lavendularis limbata</i> .	<i>talis</i> .
<i>Iraota timoleon arsaces</i> .	<i>Amblypodia centaurus pirama</i> .

In the two lists there are only three species from the Nilgiris, viz.: those asterisked, all palaeartics, that are never likely to occur in Coorg, for the very good reason that Coorg is not sufficiently high. There are others in the Nilgiri list that are not very likely to occur in Coorg, again chiefly for the reason of insufficient altitude, though it is not impossible that they should be found on the higher hills of the western rim of Coorg: these are *Y. philomela tabella*, *L. albidisca*, *N. lavendularis limbata*, and *Baracus vittatus subditus*. *Y. chenui* and *Mycalesis adolphei*, both common in the Nilgiri District, are rare on the higher points of the Coorg Ghats. The rest in the Nilgiri list should be discoverable in Coorg: some, e.g. *Azanus jesous*, *Iraota timoleon*, *Spindasis elima*, and *Gomalia elma* are all found on the Mysore plateau, which extends its forest into eastern and southern Coorg. The two *Tajuria* and *Hypolycaena nilgirica* will, if found, I think be found in the wet forest of the Ghats.

Of the list of species found in Coorg, but not so far in the Nilgiri District, there is none that may not turn up in the Nilgiris, if the artificial boundaries of the District are overleapt and the natural region, including the densely forested western and south-western slopes of the hills, be searched. Hampson confined himself, it would seem, to the Nilgiri District, the boundary of which, above the forests of Nilambur, runs along the hill tops, and does not include that long spur, called the Camel's Hump on the maps, which runs south between Vayittri and Nilambur. Again, while the District includes the eastern part of the Wynaad, the natural

region would take in the western part including the Vayittri Ghat to Calicut. This arbitrary exclusion of large parts of the natural area probably accounts for the absence of many, if not most, of the species in this exclusive Coorg list. It may be observed that the Coorg boundary on the west and south-west runs along the foot of the hills and so takes in the forest where most of the rare species are to be found. I may particularise *Amblypodia bazaloides*, *Amblypodia abseus indicus*, *Gerydus biggsii*, *Kineta microstictum*, as examples of wet forest specimens. *Astictopterus jama mercara* was taken by Col. Winckworth on the Vayittri Ghat: and Col. Fraser and Col. Winckworth took also *Parantirrhoea marshalli* there. *Pathysa antiphates naira*, not recorded from the Nilgiri District, will probably be found within the natural area of the Nilgiris.
